

BE A WATER MANAGER!

K'AD TÓ BAA 'ÁHÁLYAANI NÍLÍ!

¡SÉ ADMINISTRADOR DE AGUA!

In the Four Corners, water is distributed among many users and for many different uses. Often, specific users and types of use are given priority over others. What one user or community does with water impacts those downstream.

With limited water in the region, how can we share water fairly with all who need it? Here, you're in charge of deciding how much water is available, how water is distributed, and how water is used.

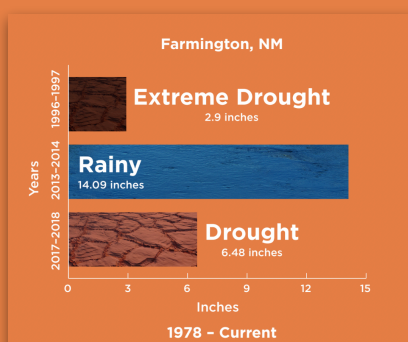

This graph shows the total amount of water that fell during rainy, drought, and extreme drought years. Scientists measure a 'water year' as the total rain and snow that falls from October through September.

How to Share When There's Little Water to Spare? Be a Water Manager!

How would you manage water in the Four Corners? In this game, the balls represent how much water falls in a year. How much do you think should go to each different use during a rainy year? How about during a drought or extreme drought?

Ready to play?

1. Press the reset button
2. Turn the wheel to fill the cloud with water
3. Choose where you want the water to go
4. Choose how much water you want to fall
